Dear Mr. Taccone:

Re: Quarterly Report – Fourth Quarter 2013 (October through December)  
Administrative Orders Hooker Chemical/Ruco Polymer Corporation Site  
Index Nos. II-CERCLA-80216, II-CERCLA-94-0210, and II-CERCLA-02-2001-2018

---

This submittal provides the Quarterly Progress Report covering October through December 2013 for the Hooker/Ruco Site in Hicksville, New York. This Report covers OU-1, OU-2, and OU-3. Please note that the next Quarterly Progress Report will be submitted by April 15, 2014 and will cover January through March 2014.

## **Quarterly Progress Report**

The following activities were performed during the period October through December 2013.

The Quarterly Progress Report for the time period July through September 2013 was submitted to the USEPA on October 15, 2013.

### ***Operable Unit 1 (On-Site Soil)***

All work has been successfully completed. OU-1 is closed.

### ***Operable Unit 2 (Soils Impacted by On-Site Release of PCBs)***

All work has been successfully completed. OU-2 is closed.

### ***Operable Unit 3 (Off-Site Groundwater)***

#### *Supplemental Treatment System*

- i. Operation and monitoring of the GP-1/GP-3 supplemental air treatment system continued
- ii. The potassium permanganate bed was changed out on November 20

#### *Biosparge System*

See Figures 1 and 2 for system layout and Figures 3 and 4 for system cross-sections. Also shown in Figures 1 and 2 are the 2012/2013 VCM groundwater concentrations.

During the reporting period, air injection into the biosparge system north fence was suspended on October 4 in preparation for the 2013 4th quarterly biosparge system performance monitoring event. Air injection resumed on October 28 after retrieval of the last sampler. Air was injected into all air injection wells for 8 hours at 100 scfm for the next week except for IW-17D2, IW-18D1, IW-19D2 and IW-22D2. No air could be injected into these four wells. It is believed that there are physical impairments in these wells. It is also believed that air injection into these wells is not essential because air is being injected into all the air injection wells immediately adjacent to and above them. Future monitoring will determine if supplemental work (extra air injections in surrounding wells or well rehabilitation of these specific wells) is needed to reduce VCM concentrations at these locations.

A fault occurred in the main Atlas Copco air compressor in November. The fault was diagnosed as a failed Variable Speed Drive. Arrangements are being made to replace the Drive. During the ensuing period, air injections are being made using the backup Ingersoll Rand compressor.

The PDB/HydraSleeve samplers for the October 2013 quarterly performance monitoring event were inserted between October 6 and 10, 2013 except for the upper two well screens in well nest MW-63 (i.e., MW-63S and MW-63I) which has 4 screens in one riser pipe and had to be sampled in a subsequent sample round (inserted on October 24 and retrieved on November 7). The samplers were retrieved between October 24 and 30. The October sampling event included 36 of the 39 biosparge groundwater monitoring wells. Wells MW-61I and MW-61D1 could not be sampled as an obstruction in these wells at approximately 130 feet below ground surface (ft. bgs) prevented insertion of the samplers. Also, the samplers in MW-77D1 could not be retrieved from the well. Attempts to retrieve the samplers were unsuccessful. The October sampling event also included the collection of samples from a supplemental group of wells to provide additional groundwater information. The additional wells included monitoring well nests MW-63, MW-67, and MW-68 and well MW-66D2. The analytical results from this sampling event and the QA/QC review are attached.

As specified in the Interim Remedial Action Report, soil vapor samples were also collected on July 25, 2013 from 14 vadose zone wells in the vicinity of the most recent injection well installations.

Notification for the January 2014 biosparge system performance monitoring event was submitted to the USEPA on December 9, 2013. The PDB/HydraSleeve samplers are to be installed starting January 6 and retrieved a minimum of 14 days after insertion. The wells to be sampled and analyzed include 23 of the

24 biosparge groundwater monitoring wells and the 14 vadose zone wells which monitor the components of the biosparge system installed in 2012. Well MW-77D1 is not available to sample as attempts to retrieve the PBD samplers for the October event were unsuccessful. Furthermore, to provide additional information regarding the current conditions of the VCM subplume, samples will be collected from well nests MW-63, MW-67, and MW-68 and well MW-66D2.

### **Summary of Biosparge System**

The Dissolved Oxygen (DO), total volatile organic compounds (TVOC), and VCM concentration trends for the individual groundwater monitoring wells around the biosparge injection system are shown on Figures 5 through 23. To date, the results show that the biosparge system is operating successfully as demonstrated by the following:

- i. DO levels in the groundwater have increased and, in general, are greater than the target concentration of 2 milligrams per liter (mg/L), in 27 of the 28 monitoring wells as measured in October.
- ii. Groundwater VCM concentrations are non-detect or decreased between the July and October 2013 performance monitoring events in 21 of the 23 monitoring wells for the expanded biosparge system as a result of the microbial biodegradation processes. The VCM concentrations, which are currently fluctuating in the remaining 2 wells for the expanded system, are expected to decrease with time. Such fluctuations in the short term after the start of air injection are similar to the pattern observed in some of the Pilot System wells during the initial year of air injection.
- iii. VCM concentrations in the Pilot System monitoring wells (see Figure 2 for area of the Pilot System) were low level ranging from non-detect to 12 ug/L in the October event.

As part of the biosparge system monitoring, soil vapor samples were collected and analyzed. The primary VOCs detected are listed in Table 3. Review of the October 2013 results shows that VCM was detected at low level concentrations (5.9 ppbv or less) in two of the seven deep vadose zone wells and was non-detect in the other deep wells. VCM was not detected in any of the seven shallow vadose zone wells.

### **Planned First Quarter 2014 Activities**

The following activities are planned for the first quarter of 2014:

- i. Continue operation and monitoring of the GP-1/GP-3 supplemental air treatment system.
- ii. Change-out of the supplemental system carbon bed is scheduled for January 8, 2014.
- iii. Perform the first 2014 quarterly biosparge system performance monitoring event. PDB/HydraSleeve insertion is scheduled to start on January 6 with retrieval planned to start a minimum of 14 days after insertion.

- iv. Continue the weekly 8-hour air injections for 26 of the 30 biosparge system air injection wells. It is noted that air injections will be temporarily suspended during the January 2014 performance monitoring event.

Should you have any questions on the above, please do not hesitate to contact me at (972) 687-7516 or e-mail at [Roger\\_Smith@oxy.com](mailto:Roger_Smith@oxy.com).

Yours sincerely,

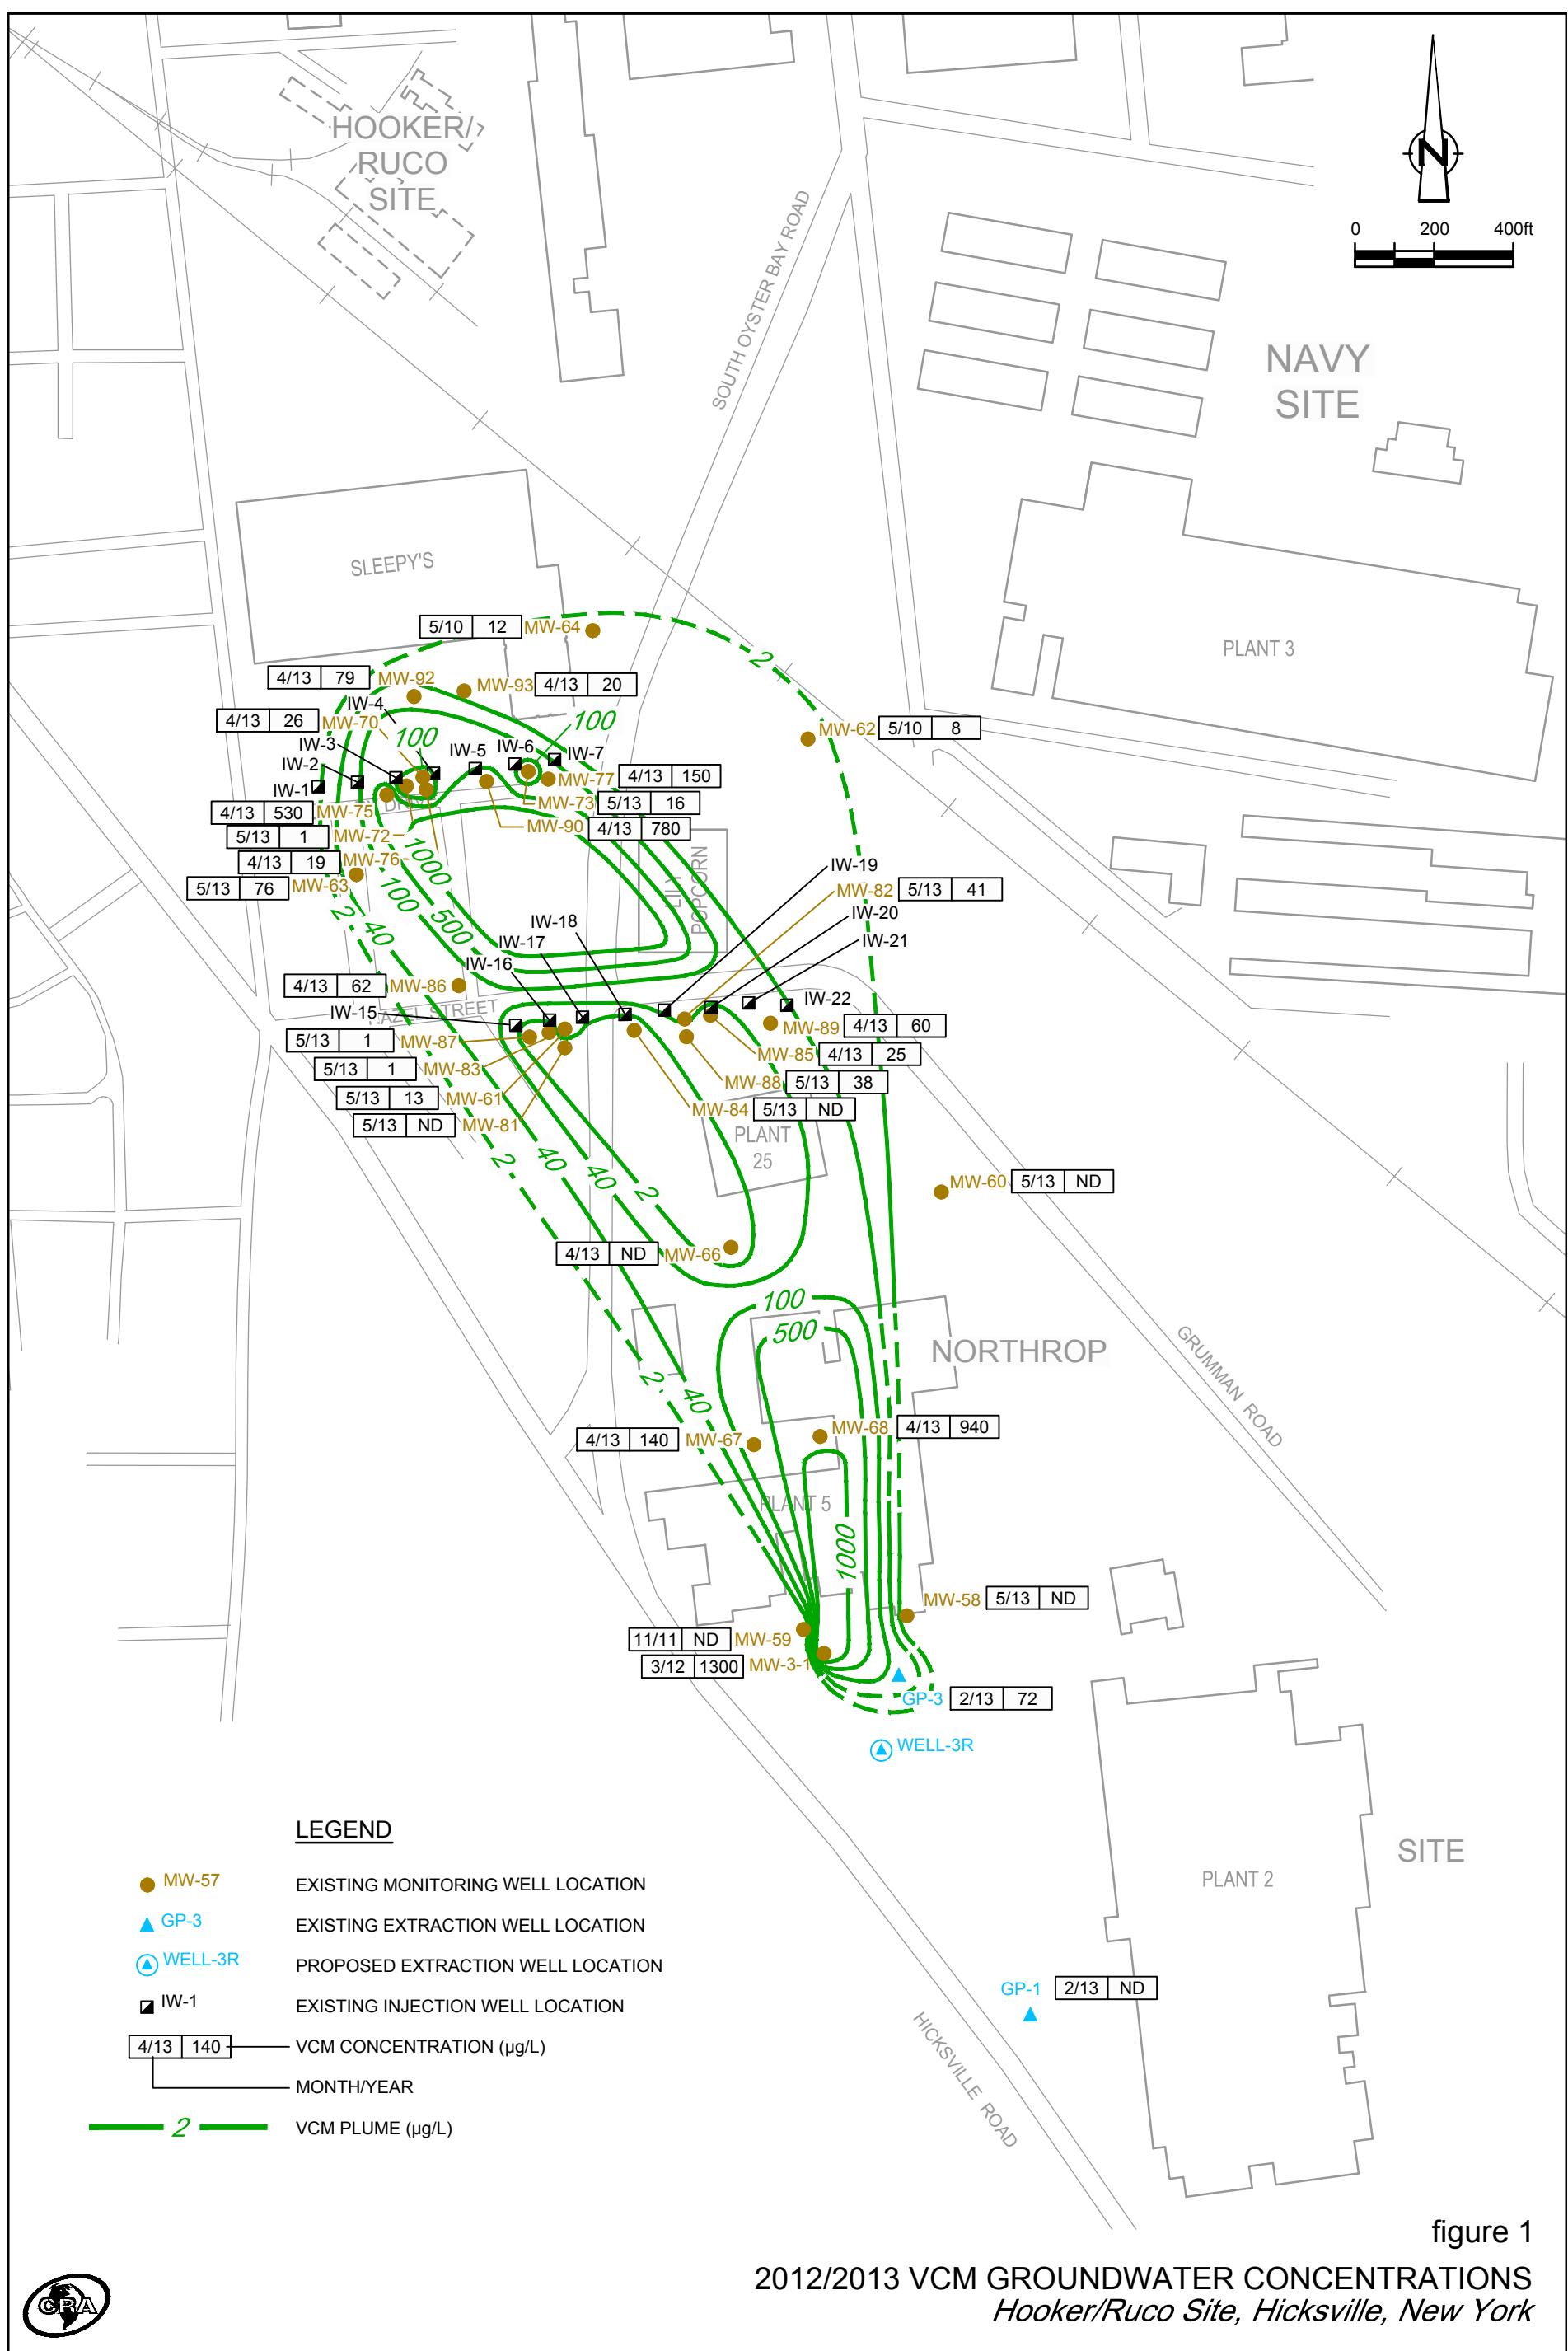

A handwritten signature in blue ink that reads "Roger Smith". The signature is fluid and cursive, with "Roger" on the left and "Smith" on the right, connected by a horizontal stroke.

## Notes:

- (1) Negative indicates groundwater level during purging higher than initial water level
- (2) Orange colored
- (3) Black coloured water prevented reading on colorimetric meter
- (4) Samples during and subsequent to November 2011 were collected using PDB/HydraSleeve samplers. No purging was required.
- (5) Insufficient sample volume to obtain measurement/reading.

NA - Not applicable

NM - Not measured (insufficient sample volume for all samples subsequent to 11/30/2011)

\* - Probe malfunctioned

## MEMORANDUM

To: Klaus Schmidtke REF. No.: 006883  
FROM: Kathy Willy/bjw/7 *KW* DATE: December 16, 2013  
**RE:** Analytical Results and Full Validation  
Quarterly Groundwater Monitoring  
Glenn Springs Holdings, Inc.  
Hicksville, New York  
October-November 2013

### 1.0 Introduction

The following document details a validation of analytical results for groundwater and soil vapor samples collected in support of the quarterly groundwater monitoring at the Hicksville Site during October and November 2013. Samples were submitted to Mitkem Laboratories, located in Warwick, Rhode Island. A sample collection and analysis summary is presented in Table 1. The validated analytical results are summarized in Tables 2A and 2B. A summary of the analytical methodology is presented in Table 3.

Full Contract Laboratory Program (CLP) equivalent raw data deliverables were provided by the laboratory. Evaluation of the data was based on information obtained from the finished data sheets, raw data, chain of custody forms, calibration data, blank data, duplicate data, recovery data from surrogate spikes, laboratory control samples (LCS), matrix spike (MS) samples, and field quality assurance/quality control (QA/QC) samples. The assessment of analytical and in-house data included checks for: data consistency (by observing comparability of duplicate analyses), adherence to accuracy and precision criteria, and transmittal errors.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the documents entitled:

- i) "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review", United States Environmental Protection Agency (USEPA) 540/R-99-008, October 1999
- ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review", USEPA 540/R-94-013, February 1994

Items i), and ii) will subsequently be referred to as the "Guidelines" in this Memorandum.

### 2.0 Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in Table 3. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

### **3.0 Gas Chromatography/Mass Spectrometer (GC/MS) – Tuning and Mass Calibration (Instrument Performance Check) and Inductively Coupled Plasma/Mass Spectrometer (ICP/MS)**

#### **Organic Analyses**

Prior to volatile organic compound (VOC) analysis, GC/MS instrumentation is tuned to ensure optimization over the mass range of interest. To evaluate instrument tuning, the method requires the analysis of specific tuning compound bromofluorobenzene (BFB). The resulting spectra must meet the criteria cited in the methods before analysis is initiated. Analysis of the tuning compound must then be repeated every 12 hours (24 hours for TO-15) throughout sample analysis to ensure the continued optimization of the instrument.

Tuning compounds were analyzed at the required frequency throughout the VOC analysis periods. All tuning criteria were met, indicating that proper optimization of the instrumentation was achieved.

### **4.0 Initial Calibration - Organic Analyses**

#### **GC/MS**

To quantify VOC compounds of interest in samples, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds of interest is analyzed to characterize instrument response for each analyte over a specific concentration range. Linearity of the calibration curve and instrument sensitivity are evaluated against the following criteria:

- i) All relative response factors (RRFs) must be greater than or equal to 0.05
- ii) The percent relative standard deviation (RSD) values must not exceed 30.0 percent or a minimum correlation coefficient (R) of 0.995 and minimum coefficient of determination ( $R^2$ ) of 0.99 if linear and quadratic equation calibration curves, respectively, are used

The initial calibration data for VOCs were reviewed. All compounds met the above criteria for sensitivity and linearity.

### **5.0 Initial Calibration – Inorganic Analyses**

Initial calibration of the instruments ensures that they are capable of producing satisfactory quantitative data at the beginning of a series of analyses. For instrumental general chemistry analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater.

After the analyses of the calibration curves, an initial calibration verification (ICV) standard must be analyzed to verify the analytical accuracy of the calibration curves. All analyte recoveries from the analyses of the ICVs must be within the following control limits:

<b><i>Analytical Method</i></b>	<b><i>Parameter</i></b>	<b><i>Control Limits</i></b>
Instrumental Wet Chemistry	TOC, ammonia, nitrate, nitrite	85 - 115%

Upon review of the data, it was determined that the calibration curves and ICVs were analyzed at the proper frequencies and that all of the above-specified criteria were met. The laboratory effectively demonstrated that the instrumentation used for metals and general chemistry analyses were properly calibrated prior to sample analysis.

## **6.0 Continuing Calibration - Organic Analyses**

### **GC/MS**

To ensure that instrument calibration for VOC analyses is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours (24 hours for TO-15).

The following criteria were employed to evaluate continuing calibration data:

- i) All RRF values must be greater than or equal to 0.05
- ii) Percent difference (%D) values must not exceed 25 percent (30 percent for TO-15)

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability with the exception of some VOCs which showed some variability. A summary of qualified results can be found in Table 4.

## **7.0 Continuing Calibration - Inorganic Analyses**

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration verification (CCV) standards are analyzed on a regular basis. Each CCV is deemed acceptable if all analyte recoveries are within the control limits specified above for the ICVs. If some of the CCV analyte recoveries are outside the control limits, samples analyzed before and after the CCV, up until the previous and proceeding CCV analyses, are affected.

For this study, CCVs were analyzed at the proper frequency. All analyte recoveries reported for the CCVs were within the specified limits.

## **8.0 Laboratory Blank Analyses**

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. Additionally, initial and continuing calibration blanks (ICBs/CCBs) are routinely analyzed after each ICV/CCV for the inorganic parameters.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

**Organic Analyses**

All method blank results were non-detect, indicating that laboratory contamination was not a factor for this investigation.

**Inorganic Analyses**

All ICBs, CCBs, and method blanks were non-detect, indicating that laboratory contamination was not a factor for this investigation.

**9.0 Surrogate spike recoveries**

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for VOCs are spiked with surrogate compounds prior to sample analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for VOC determinations were spiked with the appropriate number of surrogate compounds prior to sample analysis.

Surrogate recoveries were assessed against laboratory control limits. All surrogate recoveries met the above criteria.

**10.0 Internal Standards (IS) Analyses**

IS data were evaluated for all VOC sample analyses.

**Organics Analyses**

To ensure that changes in the GC/MS sensitivity and response do not affect sample analysis results, IS compounds are added to each sample prior to analysis. All results are then calculated as a ratio of the IS responses.

The sample IS results were evaluated against the following criteria:

- i) The retention time of the IS must not vary more than  $\pm 30$  seconds from the associated calibration standard
- ii) IS area counts must not vary by more than a factor of two (-50 percent to +100 percent) from the associated calibration standard for Method 8260
- iii) IS area counts must not be within 60 percent to 140 percent for Method TO-15

All organic IS recoveries and retention times met the above criteria.

**11.0 Laboratory Control Sample Analyses**

LCS and/or laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS and/or LCSD were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

### **Organic Analyses**

The LCS/LCSD contained all compounds of interest. All LCS recoveries and RPDs were within the laboratory control limits, demonstrating acceptable analytical accuracy and precision with the exception of a low recovery for hexachlorobutadiene. All associated sample results were qualified as estimated to reflect the implied low bias.

### **Inorganic Analyses**

The LCS/LCSD contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS recoveries and RPDs were within the control limits, demonstrating acceptable analytical accuracy and precision.

## **12.0 Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analyses**

To evaluate the effects of sample matrices on the extraction or digestion process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as MS/MSD samples. The RPD between the MS and MSD is used to assess analytical precision.

### **Organic Analyses**

The laboratory prepared and analyzed MS/MSD samples on non-investigative samples. No assessment of the data was performed.

### **Inorganic Analyses**

The MS/MSD samples were spiked with the analytes of interest, and the results were evaluated using the "Guidelines". All percent recoveries and RPD values were within the control limits, demonstrating acceptable analytical accuracy and precision.

## **13.0 Field QA/QC Samples**

The field QA/QC consisted of four trip blank samples and two rinse blank samples.

### **Trip Blank Sample Analysis**

To evaluate contamination from sample collection, transportation, storage, and analytical activities, four trip blanks were submitted to the laboratory for VOC analysis. All results were non-detect for the compounds of interest.

### **Rinse Blank Sample Analysis**

To assess field decontamination procedures, ambient conditions at the site, and cleanliness of sample containers, two rinse blanks were submitted for analysis, as identified in Table 1. All results were non-detect for the analytes of interest with the exception of low concentrations of acetone, chloromethane and phosphorous. Associated samples with concentrations similar to the blank concentrations were qualified non-detect (see Table 6).

#### **14.0 Tentatively Identified Compounds (TICs)**

Chromatographic peaks recorded during VOC sample GC/MS analyses that are not target compounds, surrogates, or IS, are potential TICs.

A summary of the TICs reported by the laboratory is presented in Table 7. Per the "Guidelines", TICs that were present in the method blanks or identified as solvent preservatives/aldol reaction products were rejected and are not included in the table.

#### **15.0 Analyte Reporting**

The laboratory reported detected results down to the laboratory's MDL for each analyte. Positive analyte detections less than the PQL but greater than the MDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this memorandum. Non-detect results were presented as non-detect at the PQL in Table 2.

#### **16.0 Target Compound Identification**

To minimize erroneous compound identification during organic analyses, qualitative criteria including compound retention time and mass spectra (if applicable) were evaluated according to the identification criteria established by the methods. The samples identified in Table 1 were reviewed. The organic compounds reported adhered to the specified identification criteria.

#### **17.0 Conclusion**

Based on the assessment detailed in the foregoing, the data summarized in Tables 2A and 2B are acceptable with the specific qualifications noted herein.
